• INTRODUCTION

This project aims to study the sleeping patterns of students by collecting data on their bedtime, wake-up time, sleep duration, mobile usage before sleep, and morning freshness.

Sleep is an important part of a student's daily routine. At the same time, mobile phone usage before sleeping has become common among students. Through this project, we wanted to understand the sleeping habits of students and how much they use their mobile phones before going to sleep.

For this study, we collected data from 20 students and analyzed the collected information using statistical methods and graphs.

- Objectives

- 1.To study the sleeping patterns of the students.
- 2.To find the average number of hours students sleep.
- 3.To study how much students use their mobile phones before sleeping (bedtime).
- 4.To find out how students feel in the morning after waking up.
- 5.To observe whether phone usage before sleep is related to students' sleeping patterns.

- **Methodology**

- a) Data Collection

We collected data from **20 students** through a simple survey. The survey included questions about their bedtime, wake-up time, sleep duration, phone usage before sleep, and morning feelings.

- b) Data Processing

We entered all the responses in a spreadsheet and arranged them in tables. We changed the time values into hours wherever needed so that the data was easy to compare.

- c) Data analysis

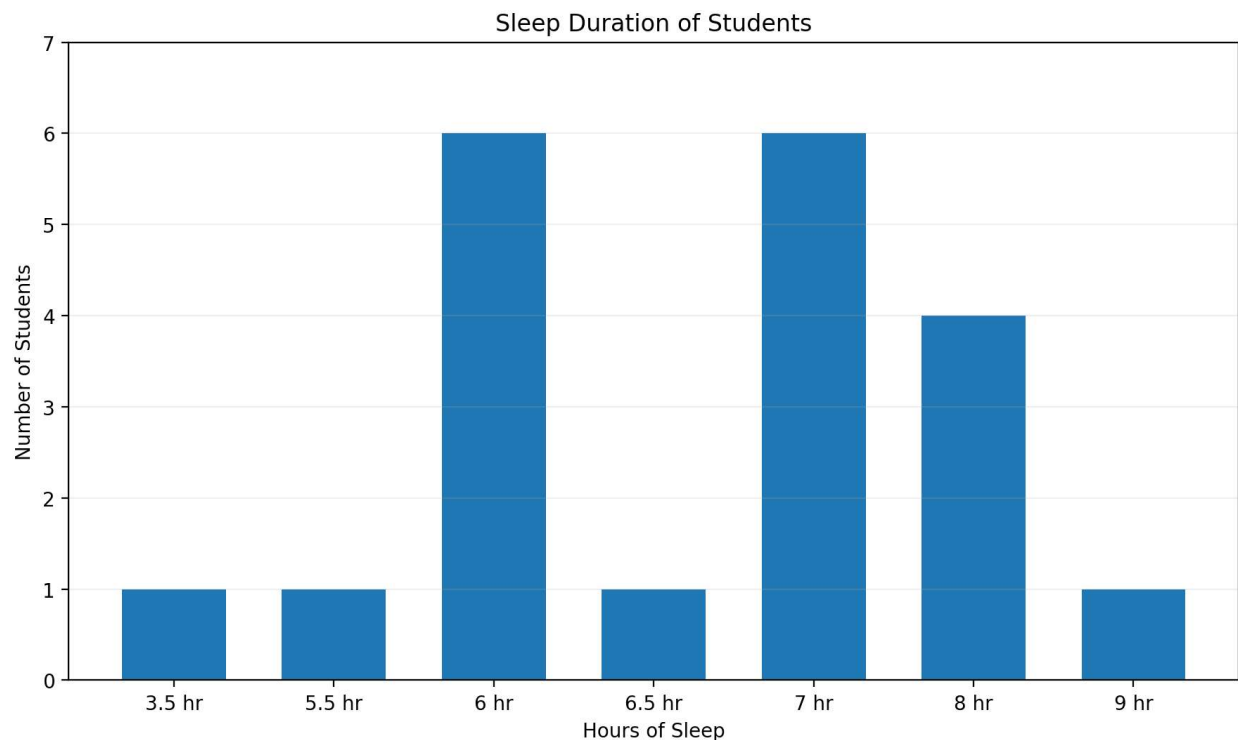

We analyzed the data using **mean, median, mode and standard deviation**. We also used different graphs to understand and present the data clearly

- Charts and Visualization

- Sleep Time

Chart Title: Sleep Duration of Students

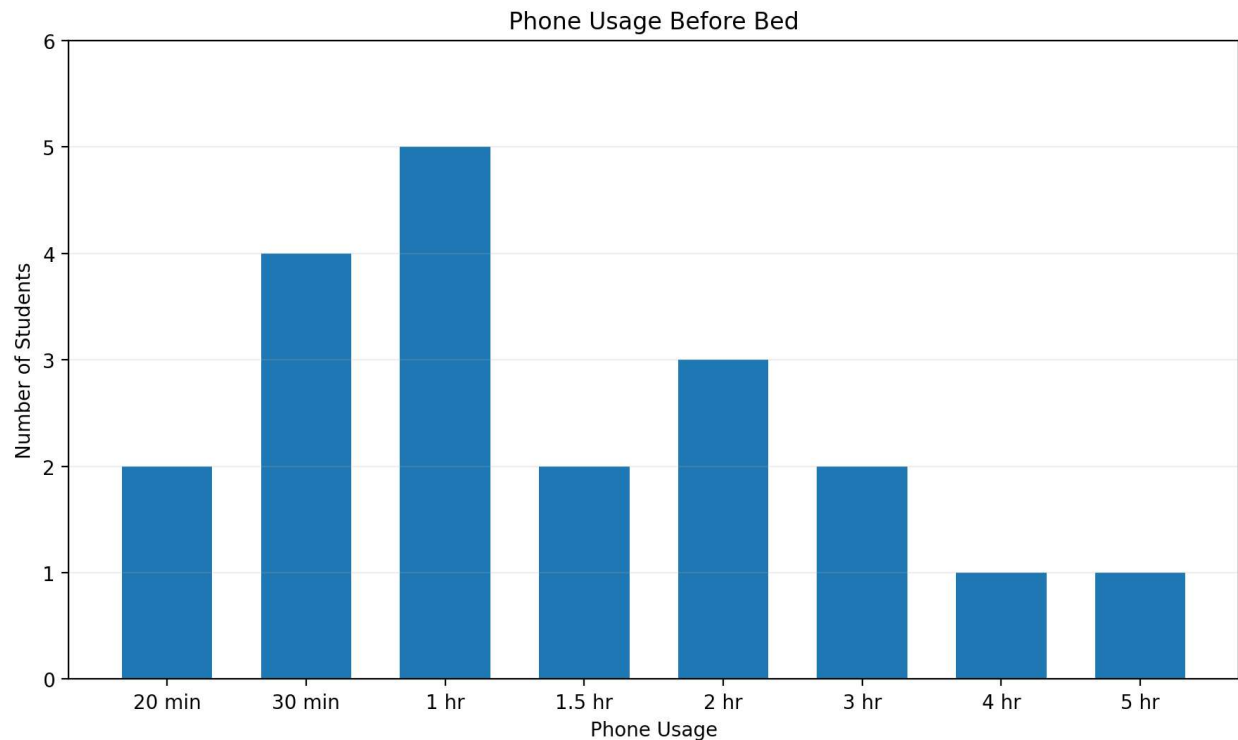

The graph shows the number of students who sleep for different hours. Most students sleep for **6 or 7 hours**, with **6 students in each group**. The average sleep duration of the students is **6.73 hours**.

- **Phone Usage Before Bedtime**

Chart Title: Phone Usage Before Bed

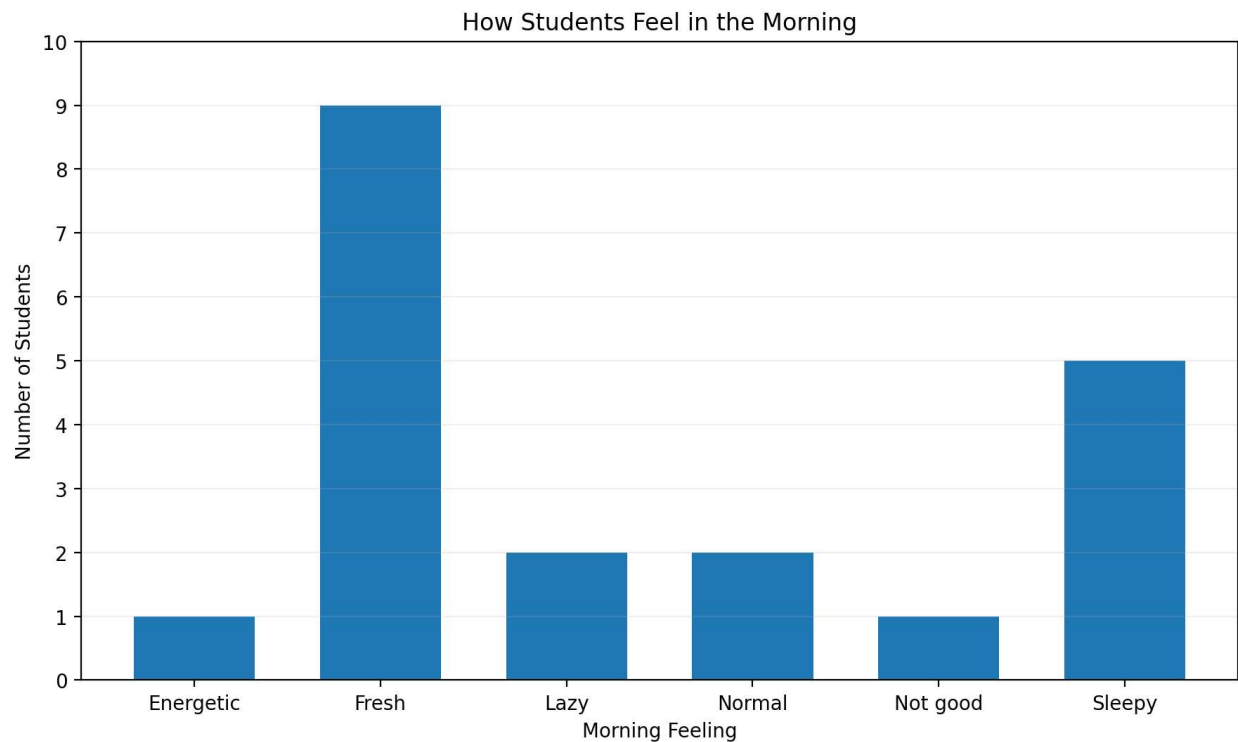

The graph shows the amount of time students use their phones before sleeping. Most students use their phones for **1 hour or less**, while a few students use their phones for 3–5 hours. The average phone usage before bed is **1.58 hours**.

- **Morning Feeling**

Chart Title: How Students Feel in the Morning

The graph shows that **9 students (45%) feel fresh** in the morning. **5 students (25%) feel sleepy**, while the remaining students feel energetic, lazy, normal or not good.

- Findings and Interpretation

From the data collected from 20 students, we found that the average sleep duration was **6.73 hours**. Most students slept for 6 or 7 hours. The average phone usage before bed was **1.58 hours**, and 1 hour was the most common usage time. We also found that **45% of students felt fresh** in the morning, while **25% felt sleepy**. The data shows that some students with higher phone usage had lower sleep duration. However, our data is not enough to prove that phone usage directly affects sleep.

- Limitations

Our study was based on only **20 students**, so the results may not represent all students. The data was collected through a survey, so some answers may not be completely accurate. We also did not consider other factors that may affect sleep, such as study time and daily routine.

- Each Group Member's Contribution

I helped in **collecting responses** for the project and preparing the **PowerPoint presentation**. I also helped in organizing the collected data and presenting the findings. Other group members helped with the remaining parts of the project.
